

• PRODUCT USER MANUAL

DataByt User Manual

Everything you need to run automated AR collections —
from first login to mastering every page of the dashboard.

Version 1.0 · Mid-market B2B AR Collections · databyt.in

Contents

1 · What DataByt Does	The 60-second overview
2 · Getting Started	Login & loading your data
3 · The Dashboard	Your 8 core metrics
4 · AR Aging	Invoices, buckets & actions
5 · Collections	The customer pipeline
6 · Disputes	Pause & resolve
7 · Analytics	Performance & trends
8 · Customers	Segments & balances
9 · Reports	Board-ready PDFs
10 · Integrations	QuickBooks, Xero, CSV, sample data
11 · Settings	Signature, rules, payment links
12 · The AI Assistant	Ask & act
13 · Your Daily Workflow	The 5-minute routine
14 · FAQ & Troubleshooting	Common questions

1 • What DataByt Does

DataByt is an AI-powered accounts receivable (AR) platform. It chases your overdue invoices automatically — so your team stops sending reminder emails by hand.

The full loop DataByt closes

Step	What happens
1 Import	Your invoices come in via QuickBooks, Xero, CSV, or sample data
2 Score	Every overdue invoice is ranked by amount, age, and customer risk
3 Email	AI sends personalised dunning emails, escalating in tone (L1 → L2 → L3)
4 Pay	Customers pay via your payment link (Stripe, bank, any URL you set)
5 Dispute	Disputes pause collections automatically until resolved
6 Analyse	Live DSO, CEI, and collection trends — board-ready in one click

The promise: Connected and live in 48 hours. No IT team. Your finance team of 1–3 can run it.

Who runs it

- **CFO / VP Finance** — watches the metrics, makes decisions
- **Controller / AR Manager** — daily operator: reviews, marks paid, handles disputes
- **The AI Assistant** — does the repetitive chasing automatically

2 · Getting Started

Step 1 — Log in

- 1 Go to **databyt.in** → click **Sign in** → enter your email and password. New here? Sign up creates your organisation automatically.

Step 2 — Get your data in (pick one)

- A Connect QuickBooks or Xero** — Dashboard → Integrations → Connect → log in → Allow. Invoices import automatically. (~5 min)
- B Import a CSV** — Integrations → Import CSV → download the template → fill it → upload. Required columns: invoice_number, customer_name, customer_email, amount, due_date.
- C Load sample data** — Integrations → Load Sample Data. Instantly fills the dashboard with realistic demo invoices so you can explore everything. (Great for testing.)

Empty dashboard? That just means no data yet. The dashboard shows a guide card pointing you to the three options above. Pick one and the whole product comes alive.

Step 3 — Set your essentials (Settings)

- Add your **email signature** (goes on every dunning email)
- Set your **payment link template** so emails include a "Pay now" link
- Confirm your **collection rules** (when L1/L2/L3 emails fire)

3 · The Dashboard

Your command center, organised in two tiers: **Financial Health** for the CFO view, **Operations** for the daily view.

Tier 1 — Financial Health

Metric	What it tells you	Healthy
Total AR Outstanding	All unpaid invoices across customers	—
DSO	Avg days to collect payment	Under 45
Collection Effectiveness (CEI)	% of collectible cash you actually collected	80%+
Overdue % of AR	Share of your AR that's past due	Under 30%

Tier 2 — Operations This Month

Metric	What it tells you
Collected This Month	Payments received + trend vs last month
Avg Days Delinquent	How late your overdue invoices are, on average
Active Disputes	Open disputes needing resolution (green = all clear)
Emails Sent (Month)	How many dunning emails DataByt sent for you

Below the metrics: **AR Aging Buckets** (how your money spreads across overdue ranges) and **Top Overdue Customers** (who to chase first).

Read the metrics in order. Start top-left. If DSO is rising and CEI is falling, your collections are slipping — act before it shows up in cash.

4 · AR Aging

The operational heart of DataByt. Every invoice, grouped by how overdue it is — and where you take action.

The aging buckets

Bucket	Meaning
Current	Not yet due — healthy
1–30 days	Recently late — gentle reminders
31–60 days	Getting serious — firm follow-up
61–90 days	High risk — escalate
90+ days	Critical — may become bad debt

The invoice table — your 3 actions

Each invoice row (on the **Action** column) gives you three buttons:

- 1 Email** — opens the AI email drafter. Pick escalation level (L1/L2/L3), the AI writes it, you review and send.
- 2 Pay link** — copies a payment link for that invoice (if you've set a template in Settings). If not set, it links you to Settings to add one.
- 3 Mark Paid** — the green button. Click it the moment a customer pays. The invoice updates instantly and stops further chasing.

Always Mark Paid when a payment lands. DataByt can't see your bank account — when you confirm a payment, click Mark Paid so it stops emailing a customer who already paid. Takes 5 seconds.

Use the **filter tabs** (All / Overdue / Open / Paid) and the **search box** to find invoices fast.

5 • Collections

See exactly where every customer sits in the chasing process. Two tabs: Pipeline and Email Activity.

The Customer Pipeline

Every customer shows a **stage badge** so you know at a glance who's been contacted and how far they've escalated:

Stage	Meaning
Not Contacted	Overdue but no email sent yet — queued for the next run
L1 Sent	Friendly first reminder sent (1–9 days late)
L2 Sent	Firm reminder with deadline (10–29 days late)
L3 Final	Final notice sent (30+ days late)
Disputed	Dispute raised — collections paused
Paid	All invoices settled

Each row also shows: total owed, overdue invoice count, max days late, last email date, and total emails sent.

Email Activity tab

A live log of every dunning email sent — customer name, subject, date, and status (sent / opened / clicked). This is your proof that the AI is working.

This page is your USP made visible. When a CFO asks "is anything actually happening?" — this pipeline is the answer.

6 • Disputes

When a customer contests an invoice, collections should pause — not keep nagging. Disputes handle that.

How disputes work

- 1 File** — from AR Aging, click the dispute icon on an invoice (or ask the AI Assistant). Pick a reason: incorrect amount, goods not received, duplicate, already paid, service not rendered, other.
- 2 Pause** — collections automatically stop for that invoice while the dispute is open.
- 3 Resolve or reject** — from the Disputes page. Resolving resumes collections; the invoice returns to its normal flow.

Why this matters: Chasing a customer who has a legitimate dispute destroys the relationship. Disputes keep you professional.

7 • Analytics

The deep-dive view for performance and trends over time.

- **Collection Effectiveness Index (CEI) gauge** — your headline collections score
- **Email performance** — sent, open rates, payment conversion
- **DSO trend** — is it improving month over month?
- **Active disputes & avg days to pay**

Use Analytics to answer the board's questions *before* they ask them.

8 • Customers

Your full customer list with balances, invoice counts, and segments.

Customer segments — and why they matter

Segment	How DataByt treats them
Strategic	High-value. Emails are extra courteous — protect the relationship.
Standard	Normal escalation tone.
At-risk	History of late payments. Emails are firmer and more direct.

Set a customer's segment by editing them here. The AI adjusts its email tone accordingly.

9 • Reports

One click → a board-ready PDF.

Dashboard → Reports → **Generate PDF Report**. Includes AR aging summary, total outstanding, collection rate, and top overdue customers. Perfect for board meetings and finance reviews — no manual spreadsheet work.

10 • Integrations

Where your data comes from. Three live options + more on the roadmap.

Option	Use when
QuickBooks Online	You run accounting in QuickBooks — syncs invoices daily
Xero	You run accounting in Xero — pulls outstanding invoices
CSV Import	You use any other system — export to CSV, upload
Load Sample Data	You want to explore/demo before connecting real data

Coming soon: NetSuite, Sage, and more ERP connectors.

11 • Settings

Setting	What it controls
Email Signature	The sign-off on every dunning email
Collection Rules	Day thresholds for L1/L2/L3 + cooldown between emails
Payment Collection	Your payment link template (use INVOICE_NUMBER as the placeholder)
Currency	Your default billing currency

Set the payment link first. Emails with a one-click "Pay now" link get paid noticeably faster than emails without one.

12 • The AI Assistant

The chat widget (bottom-right of every dashboard page). It doesn't just answer — it **takes actions**.

What you can ask

- "Who owes me the most?" → ranked list of overdue customers
- "How many overdue invoices do I have?" → live count
- "What's my total AR outstanding?" → the number
- "How much does [customer] owe?" → that customer's balance + breakdown
- "When did we last email [customer]?" → communication history
- "How do I connect QuickBooks?" → product help

What it can do (actions)

- **Send a reminder** — "Send a reminder to [customer]" → it confirms, then sends
- **File a dispute** — "File a dispute for INV-023" → it confirms reason, then files

It always confirms before acting. The Assistant will never send an email or file a dispute without asking you first.

The toolbar

- **Minimize** (–) keeps your chat session alive in a small bar; **Close** (×) closes it
- **Escalate an issue** — sends a flagged message to the DataByt team
- **Request a feature** — submit an idea directly

13 • Your Daily Workflow

DataByt does the heavy lifting automatically. Your job is a 5-minute daily check.

The automatic part (no action needed)

- Dunning emails go out **Monday–Friday at 8am**, escalating by age
- Cooldown of **3 days minimum** between emails to the same customer
- Disputes pause collections automatically

Your 5-minute daily routine

- 1 Open the Dashboard** — glance at DSO, CEI, Overdue %. Anything red?
- 2 Check your bank** — any payments landed? Go to AR Aging → **Mark Paid** on those invoices.
- 3 Review Disputes** — resolve or reject anything open.
- 4 Scan the Collections pipeline** — any "Not Contacted" customers that need a manual nudge? Use the AI Assistant.

That's it. Five minutes a day. The system runs the other 23 hours and 55 minutes.

Weekly

- Generate a Reports PDF for your records / the board
- Review Analytics — is DSO trending down? Is CEI above 80%?

14 • FAQ & Troubleshooting

The dashboard is empty.

You have no invoice data yet. Go to Integrations and connect QuickBooks/Xero, import a CSV, or load sample data.

A customer paid but still shows overdue.

DataByt can't see your bank. Go to AR Aging → find the invoice → click **Mark Paid**. This is the one manual step (or reconnect your accounting integration so payments sync automatically).

Why does a new customer show "Not Contacted"?

Dunning emails run Mon–Fri at 8am. New overdue invoices wait for the next scheduled run. Nothing is broken — it's queued.

How do I stop emails to one customer?

Mark their invoices as paid, or file a dispute — both pause collections for that customer.

Can I customise the email tone?

Yes — set the customer's segment (Strategic / Standard / At-risk) in Customers, and adjust thresholds in Settings → Collection Rules.

The AI Assistant says "unavailable."

Usually a temporary connection issue — try again in a moment. If it persists, use the "Escalate an issue" button in the chat.

How do I get a board report?

Reports → Generate PDF Report. One click.

NEED HELP?

Use the AI Assistant's "Escalate an issue" button, or email support@databyt.in.
